*Certainly, this is the finest job by any publisher. I was able to comprehend almost everything out of this published e book. You wont truly feel monotony at at any moment of the time (that's what catalogues are for concerning should you question me).*

On the horizontal plane the accelerating force is  $jo, =-fg----0,03. 32,2 = 0,966$  feet  $j$  hence, the 243. Rolling motion.--When a carriage rolls down an inclined plane, the friction of the axle chiefly acts in opposition to the accelerating force; if  $r$  be the radius of the axle, and  $a$  that of the wheel, the friction will amount to  $--N--G \cos. a$ , and hence  $a$  the accelerating force  $p=(\sin.a----\cos.a) G$ . If a round body  $AB$ , a cylinder or sphere, for example, roll Fig. 299. down an inclined plane  $FH$ , Fig. 299, we have to consider a progressive and a rotatory motion at the same time. Generally the acceleration of the progression is equal to that of the rotation ( 156); since if we put the moment of inertia of the rolling body =  $G y$ , and the radius of the cylinder =  $o$ , we shall then obtain for the force  $AK=K$ , with which the cylinder is set into revolution by virtue of the penetration of its  $Gv$  parts into those of the inclined plane:  $K=p.----$ . But the force  $r r g a K$  acts opposed to the force for descent  $G \sin. a$ , hence it follows that the moving force for progressive motion =  $G \sin. a--K$ ,  $. G \sin. a--K$  and the accelerating force...
